In geometry, an isosceles triangle is a triangle that has two sides of equal length. Sometimes it is specified as having exactly two sides of equal length, and sometimes as having at least two sides of equal length, the latter version thus including the equilateral triangle as a special case. Examples of isosceles triangles include the isosceles right triangle, the golden triangle, and the ... A right triangle is triangle with an angle of 90 degrees ( $\pi/2$  radians). The sides  $a$ ,  $b$ , and  $c$  of such a triangle satisfy the Pythagorean theorem  $a^2+b^2=c^2$ , (1) where the largest side is conventionally denoted  $c$  and is called the hypotenuse. The other two sides of lengths  $a$  and  $b$  are called legs, or sometimes catheti. The favorite A-level math exam question of the protagonist Christopher in ... Free practice questions for Basic Geometry - How to find the perimeter of a right triangle. Includes full solutions and score reporting. The word isosceles is pronounced "eye-sos-ell-ease" with the emphasis on the 'sos'. It is any triangle that has two sides the same length. If all three sides are the same length it is called an equilateral triangle. Obviously all equilateral triangles also have all the properties of an isosceles triangle. - Perimeter Of A Isosceles Right Triangle
